Natural Frequency and Damping Ratio

Natural frequency (ω_n) indicates the frequency at which a system tends to oscillate in the absence of damping and external forcing. It is given by:

$$\omega_n = \sqrt{\frac{k}{m}}$$

$$\omega_n = \sqrt{\frac{k}{m}}$$

]

where k is the stiffness and m is the mass.

The damping ratio (ζ) determines how oscillations decay over time:

[

$$\zeta = \frac{c}{2\sqrt{km}}$$

]

where c is the damping coefficient.

Understanding these parameters helps in designing systems that avoid resonance and excessive vibrations.

Free and Forced Vibrations

- Free Vibrations occur when a system is displaced from its equilibrium position and allowed to oscillate without external forces.
- Forced Vibrations happen when an external periodic force acts on the system, often leading to resonance if the forcing frequency matches the natural frequency.
