Cisco voice interview questions

Cisco voice interview questions

Preparing for a Cisco voice-related interview can be a challenging yet rewarding experience for

networking professionals aiming to specialize in Voice over IP (VoIP) solutions. Cisco's voice technology is a cornerstone of modern enterprise communication systems, and understanding the key concepts, protocols, and configurations is essential for success. This article provides an extensive collection of Cisco voice interview questions, covering fundamental and advanced topics, to help candidates confidently prepare for their interviews.

Understanding Cisco Voice Fundamentals

1. What is Cisco VoIP, and how does it differ from traditional telephony?

- Cisco VoIP enables voice communication over IP networks, replacing traditional Public Switched Telephone Network (PSTN) with internet-based systems.
- It uses packet-switched networks to transmit voice data, leading to cost savings and greater scalability.
- Traditional telephony relies on circuit-switched networks, which dedicate a fixed bandwidth for each call, whereas VoIP dynamically shares bandwidth.

2. What are the main components of a Cisco VoIP network?

- Call Agents (Cisco CUCM): Centralized call control platform managing call routing and signaling.
- Gateways: Devices connecting VoIP networks to PSTN or other legacy telephony systems.
- IP Phones: End-user devices that communicate over IP networks.
- Gatekeepers: Optional devices providing call admission control and zone management.
- Proxy and Registrar Servers: Handle SIP signaling for registering and locating IP phones.

3. Explain the role of Cisco Unified Communications Manager (CUCM).

- CUCM, formerly known as CallManager, acts as the call-processing platform.
- It manages call setup, teardown, routing, and features like voicemail and conferencing.
- Provides centralized control for VoIP endpoints and integrates with other Cisco collaboration tools.

Protocols Used in Cisco Voice Networks

4. What are the main signaling protocols used in Cisco VoIP systems?

- SIP (Session Initiation Protocol): Used for establishing, modifying, and terminating multimedia sessions.
- H.323: An older protocol suite for multimedia communications, still in use in some networks.
- MGCP (Media Gateway Control Protocol): Controls gateways from call agents like CUCM.
- SCCP (Skinny Client Control Protocol): Cisco proprietary protocol for communication between IP phones and CallManager.

5. Describe the purpose of RTP and RTCP in VoIP.

- RTP (Real-time Transport Protocol): Handles the actual media stream (voice packets).
- RTCP (RTP Control Protocol): Provides quality of service feedback and synchronization information.

6. How does Cisco prioritize voice traffic over data traffic?

- Using Quality of Service (QoS) policies.
- Implementing marking protocols like DSCP (Differentiated Services Code Point).
- Applying traffic shaping and queuing mechanisms to ensure low latency and minimal jitter for voice packets.

Configuration and Deployment Questions

7. What are the key steps to configure a Cisco IP Phone with CUCM?

- Configure the network settings (IP address, subnet mask, default gateway).
- Register the IP phone with CUCM via DHCP options or manual configuration.
- Associate the phone with a device profile in CUCM.
- Assign a line or extension number.
- Enable necessary features such as call forwarding or voicemail.

8. How do you configure a Cisco gateway for VoIP?

- Set up the gateway's IP address and network settings.
- Configure dial peers for call routing.
- Enable and configure protocol-specific settings (SIP, H.323, MGCP).
- Set up translation rules and digit manipulation if needed.
- Ensure proper routing to PSTN or other networks.

9. What is the purpose of dial peers in Cisco voice configuration?

Understanding these components forms the basis for most interview questions related to Cisco voice solutions.

Common Cisco Voice Interview Questions

- What is Cisco Unified Communications Manager (CUCM), and what are its primary functions?

Answer:

Cisco Unified Communications Manager (CUCM) is Cisco's enterprise call-processing system. It acts as the central signaling and call control platform for voice, video, messaging, and mobility applications within an organization. Its primary functions include:

- Managing and controlling IP-based voice and video calls.
- Handling registration, authentication, and call routing for IP phones.
- Providing features such as call forwarding, transfer, hold, and conference.
- Integrating with other Cisco collaboration tools and third-party applications.
- Supporting scalability for small to large enterprise deployments.

Interview Tip: Be prepared to discuss how CUCM interacts with endpoints like IP phones and gateways, and how it manages call signaling via protocols like SIP and SCCP.

- Can you explain the difference between SCCP and SIP protocols in Cisco voice networks?

Answer:

Skinny Client Control Protocol (SCCP):

- Proprietary Cisco protocol primarily used for communication between Cisco phones and CUCM.
- Designed for simplicity and efficiency within Cisco environments.
- Offers features like call control, device provisioning, and call management.

Session Initiation Protocol (SIP):

- Open standard protocol widely adopted across various VoIP systems.
- Provides greater flexibility and interoperability with third-party devices and services.
- Supports advanced features like presence, instant messaging, and video conferencing.

Differences:

- Compatibility: SCCP is Cisco-specific, while SIP can integrate with multiple vendors.
- Features: SIP generally offers more advanced features and scalability.
- Deployment: SCCP is commonly used with Cisco IP phones, but SIP is increasingly preferred for its openness.

Interview Tip: Be ready to discuss scenarios where each protocol might be preferred, and how to configure SIP trunks in a Cisco environment.

- What are Cisco SIP trunks, and how do they function within a voice network?

Answer:

Cisco SIP trunks are virtual connections that enable voice communication between an enterprise's Cisco voice infrastructure and external VoIP service providers or other SIP-based systems. They replace traditional PSTN lines, allowing organizations to make and receive calls over the internet.

How they function:

- The SIP trunk acts as a logical pathway, carrying SIP signaling and RTP media streams.
- It is configured on Cisco routers or gateways to connect to service providers.
- Call setup and teardown are managed via SIP signaling messages.
- Supports features like caller ID, call forwarding, and emergency services through proper configuration.

Implementation considerations:

- Proper configuration of dial plans, transformation rules, and codecs.
- Ensuring security with encryption and SIP authentication.
- Quality of Service (QoS) settings to prioritize voice traffic.

Interview Tip: Be familiar with the configuration steps of SIP trunks and common troubleshooting techniques.

- Describe the concept of dial plans in Cisco voice solutions.

Answer:

A dial plan in Cisco voice solutions defines how dialed numbers are interpreted and routed within the network. It determines the pattern matching rules to identify different types of calls (local, long-distance, international) and directs them accordingly.

Key elements of dial plans:

- Digit Patterns: Specify which numbers match certain call types.
- Transformation Rules: Modify dialed numbers to match the format required by the destination.
- Route Patterns: Map dialed digits to specific gateways or trunks.
- Calling Search Space: Defines the set of routes available for outbound calls.

Example:

- Dialing '9' followed by a number to access external lines.
- Converting an internal extension '1234' to an external number '+1xxx5551234'.

Importance:

- Ensures proper call routing.
- Enforces organizational dialing policies.
- Prevents unauthorized calls.

Interview Tip: Be prepared to explain how to configure dial peers and route patterns on Cisco routers.

- What is H.323 protocol, and how does it compare to SIP in Cisco voice networks?

Answer:

H.323 is an ITU-T standard protocol suite for multimedia communication over packet-switched networks, including voice, video, and data.

Comparison with SIP:

Aspect	H.323	SIP
-----	-----	-----

| Protocol Type | Proprietary/ITU standard | Open standard (IETF) |

| Complexity | More complex to configure and troubleshoot | Simpler and more flexible |

| Scalability | Suitable for small to medium deployments | Designed for large-scale deployments |

| Features | Supports voice, video, data, and presence | Extends to presence, messaging, and collaboration |

| Use in Cisco Networks | Historically used but less common now | Increasingly preferred for new deployments |

In Cisco environments:

- H.323 was traditionally used for video conferencing and voice gateways.
- SIP has largely supplanted H.323 due to its flexibility and simplicity.

Interview Tip: Understand scenarios where H.323 might still be in use and its interoperability with SIP.

Practical Scenarios and Troubleshooting

- How would you troubleshoot a situation where IP phones cannot register with CUCM?

Approach:

- Verify network connectivity and VLAN configurations.
- Check for correct IP addressing and subnet masks.
- Confirm the IP phones are configured with the correct CUCM server IP.
- Examine the phone's logs for registration errors.
- Ensure the Cisco Unified Communications services are running.
- Check for proper DHCP options if phones are obtaining IPs via DHCP.
- Validate that necessary ports (e.g., SIP or SCCP) are open and not blocked by firewalls.
- Confirm the Cisco TFTP server is reachable and serving the correct configuration files.

Key takeaway: Troubleshooting involves examining network connectivity, device configuration, and server status.

- How do you secure Cisco voice deployments?

Strategies include:

- Using TLS for SIP signaling encryption.
- Employing SRTP (Secure Real-time Transport Protocol) for media encryption.
- Implementing access control lists (ACLs) to restrict unauthorized access.
- Using strong passwords and authentication mechanisms.
- Enabling Cisco Unified Border Element (CUBE) security features.

Question What are the key components of Cisco Voice over IP (VoIP) architecture? The key components include Cisco Unified Communications Manager (CUCM), Cisco gateways (such as VG series or ISR routers), Cisco IP phones, Cisco Unity Connection for voicemail, Cisco Unity Express, and Cisco Unified Border Element (CUBE) for SIP trunking and session border control. **Answer** How does Cisco CUCM handle call routing and call control? CUCM manages call routing through dial plans, partitions, and calling search spaces. It controls call setup, teardown, and feature access by processing signaling protocols like SCCP or SIP, and integrates with gateways and IP phones to establish and manage calls. What is H.323 and SIP, and how do they differ in Cisco voice deployments? H.323 and SIP are signaling protocols used for VoIP communication. H.323 is an older protocol focusing on multimedia communication over IP networks, while SIP is more flexible, lightweight, and widely adopted for session management. Cisco supports both, but SIP is preferred for its scalability and ease of integration. Explain the concept of dial plan in Cisco voice systems. A dial plan defines how phone numbers are interpreted and routed within the Cisco voice network. It includes patterns, partitions, and translation rules to determine call destinations, enabling features like call forwarding, routing, and number normalization. What are common causes of voice quality issues in Cisco VoIP networks, and how can they be mitigated? Common causes include jitter, latency, packet loss, and insufficient bandwidth. Mitigation strategies involve QoS configuration to prioritize voice traffic, ensuring adequate bandwidth, proper network design, and using tools like Cisco Prime or IP SLA to monitor performance. Describe the role of Cisco Unified Border Element (CUBE) in a voice network. CUBE acts as a session border controller that provides SIP trunking, protocol translation, security, and routing functions at the network edge. It enables secure and reliable SIP communication between internal Cisco voice infrastructure and external service providers. What is SRST in Cisco voice solutions, and when is it used? SRST (Survivable Remote Site Telephony) provides local call processing at branch sites during WAN failures, allowing phones to register locally with SRST routers. It ensures continuity of voice services when connectivity to the primary CUCM is lost. How do Cisco IP phones register and authenticate with CUCM? Cisco IP phones register with CUCM using DHCP options or manually configured IP addresses, and authenticate via MAC address or username/password in the case of Cisco Unified Communications Manager Express. The registration process involves SIP or SCCP signaling establishing a session between the phone and CUCM. What are some common troubleshooting steps for resolving call drop issues in Cisco VoIP? Troubleshooting steps include checking network connectivity, verifying QoS settings, examining call logs and traces on CUCM, inspecting gateway configurations, and monitoring network performance metrics such as latency and jitter to identify and resolve underlying issues. How does QoS improve voice quality in Cisco VoIP networks? QoS prioritizes voice traffic over data by marking packets with DSCP or CoS values and configuring network devices to prioritize these packets. This reduces latency, jitter, and packet loss, ensuring clear and reliable voice communication.
