- Send ACMD41 repeatedly until the card exits idle state.

- Set Block Length
- Typically 512 bytes (standard block size).
- Read/Write Data Blocks
- Use CMD17 (read single block) or CMD24 (write single block).
- Handle data tokens and CRCs.

## Handling the FAT File System

Most SD cards operate with FAT16 or FAT32 file systems. To manage files, folders, and data efficiently, developers often utilize existing FAT libraries optimized for embedded systems, such as:

- FatFs by ChaN
- Petit FatFs
- Custom implementations tailored for PIC microcontrollers

These libraries handle:

- An input coupler that divides the optical signal into two paths.
- Two arms (or waveguides) where phase modulation occurs.
- An output coupler that recombines the two paths, resulting in an intensity-modulated output signal.

The device's ability to control the phase difference between the two arms allows precise modulation of the transmitted light's intensity, amplitude, or phase, depending on the application.

### Importance in Optical Communication Systems

In high-speed optical telecommunication networks, the MZM is favored for its:

- High bandwidth capabilities: Enabling data rates of hundreds of gigabits per second.
- Linear modulation characteristics: Ensuring minimal signal distortion.
- Low chirp and high extinction ratios: Improving signal clarity and reducing cross-talk.
- Compatibility with integrated photonics: Facilitating miniaturization and mass production.

Given these advantages, accurate modeling of MZMs is essential for designing robust, efficient optical systems.

## Mathematical Foundations of Mach Zehnder Modulators

### Basic Operating Principles

The operation of an MZM hinges on the interference of two light beams with controllable phase differences. The intensity  $I_{\text{out}}$  of the output light can be expressed as:

$$I_{\text{out}} = I_{\text{in}} \cdot \cos^2 \left( \frac{\Delta \phi}{2} \right)$$

where:

- $I_{\text{in}}$  is the input light intensity.
- $\Delta \phi$  is the phase difference between the two arms, which is modulated by an applied voltage  $V(t)$ .

The phase difference  $\Delta \phi$  can be modeled as:

$$\Delta \phi(t) = \frac{\pi V(t)}{V_{\pi}} + \phi_0$$

where:

- $V_{\pi}$  is the half-wave voltage?the voltage required to induce a phase shift of  $\pi$ .
- $\phi_0$  accounts for any static phase offset due to biasing or imperfections.

Thus, the modulator acts as a voltage-controlled interferometer, translating electrical signals into optical intensity variations.

### Modeling the MZM in MATLAB Simulink

Simulink provides a flexible environment for constructing the mathematical model of an MZM. The core goal is to simulate the modulation process, including nonlinearities, biasing conditions, and potential distortions.

The typical simulation involves:

- A source block generating the electrical modulation signal.
- A voltage-to-phase conversion block modeling the phase shift.
- An interference block computing the resulting output intensity.
- Optional noise, distortion, or feedback loops for more realistic modeling.

  - Multiply the electrical signal by this gain to calculate the phase shift  $\left( \Delta \phi(t) \right)$ .
- Phase Modulation and Interference:
  - Use mathematical function blocks like `cos` or `sin` to simulate the interference pattern.
  - For phase modulation, model the output as  $I_{out}(t) = I_{in} \cdot \cos^2 \left( \frac{\Delta \phi(t)}{2} \right)$ .
