Installing Samba 4

This section covers the core steps to install Samba 4 on your Linux server.

Adding Necessary Repositories

Depending on your Linux distribution, you may need to add specific repositories or update existing ones to access the latest Samba packages.

For Ubuntu/Debian

```
sudo apt update
```

```
sudo apt install samba smbclient krb5-user dnsutils
```

For CentOS/Fedora

```
sudo dnf install samba samba-client samba-common krb5-workstation bind-utils
```

Installing Samba from Package Manager

Execute the appropriate command for your distribution to install Samba 4.

Ubuntu/Debian

```
sudo apt install samba
```

CentOS/Fedora

```
sudo dnf install samba
```

Verifying the Installation

Ensure Samba is installed correctly by checking its version:

```
smbd --version
```

This should output the installed Samba version, confirming the installation was successful.

Provisioning Samba as an Active Directory Domain Controller

The next crucial step is to provision Samba 4 to act as your organization's AD DC.

Preparing the Environment

- Stop any running Samba services:

```
sudo systemctl stop smbd nmbd
```

- Backup existing Samba configurations if necessary.

Provisioning the Domain

Run the Samba provisioning command with your desired domain details:

```
sudo samba-tool domain provision --use-rfc2307 --interactive
```

During the process, you'll be prompted to specify:

- Domain name (e.g., EXAMPLE)
- Realm (e.g., EXAMPLE.COM)
- DNS forwarder IP address (e.g., your ISP's DNS or internal DNS server)
- Administrator password for the domain

Configuring the Kerberos Realm

The provisioning process generates a Kerberos configuration file (/etc/krb5.conf) tailored to your domain. Review and adjust it if necessary to match your network setup.

Configuring and Starting Samba Services

Once provisioned, configure Samba to start automatically and verify its operation.

Systemd Service Management

```
sudo systemctl enable samba-ad-dc
```

```
sudo systemctl start samba-ad-dc
```

Check service status:

```
sudo systemctl status samba-ad-dc
```

DNS Configuration

Samba 4 manages its own DNS server by default. Ensure that your server's DNS settings point to the Samba DNS or configure your network to use it as the primary DNS resolver.

Firewall Settings

Open necessary ports for Samba and DNS:

```
sudo firewall-cmd --add-service=samba --permanent
```

```
sudo firewall-cmd --add-service=dns --permanent
```

```
sudo firewall-cmd --reload
```

Joining Windows Clients to the Samba Domain

After successfully setting up Samba as a domain controller, clients can join the domain.

Creating User Accounts

```
sudo samba-tool user create username
```

Adding Machines to the Domain

On Windows clients, navigate to System Properties > Change settings > Change, then select "Domain" and enter your domain name. You'll need administrator credentials to join.

Verifying Domain Membership

- Use command prompt: net ads testjoin
- Check the list of domain members on your Samba server:

```
sudo samba-tool domain info yourdomain
```

Managing and Maintaining Samba 4

Continual management ensures your Samba AD remains secure and efficient.

Managing Users and Groups

- Create users: sudo samba-tool user create username
- Modify user attributes
- Create and manage groups similarly using samba-tool commands

Implementing Group Policies

Samba 4 supports GPOs through tools like *Samba GPO* or by integrating with Windows management tools. Proper GPO setup enables centralized policy enforcement.

Backing Up Samba Data

- Backup configuration files (/etc/samba)
- Export LDAP data using `ldbsearch`
- Maintain regular snapshots of your system and domain data

Updating Samba 4

Keep Samba updated to benefit from security patches and new features:
`sudo apt update && sudo apt upgrade samba` or `sudo dnf update samba`

Troubleshooting Common Issues

Deploying Samba 4 can encounter obstacles; here are some typical problems and solutions.

DNS Resolution Failures

- Verify DNS records and forwarders
- Ensure the server correctly resolves its own hostname

Kerberos Authentication Problems

- Check /etc/krb5.conf for correct realm and KDC settings
- Ensure time synchronization across all machines

Samba Service Not Starting

- Review logs in /var/log/samba/
- Validate configuration syntax with `samba-tool testparm`

- Up-to-date information: Reflects the latest features and security considerations.
- Community support: Provides links to mailing lists, forums, and further documentation.

Preparing for Samba 4 Deployment

Successful deployment begins with thorough preparation. The official Howto emphasizes planning and environment assessment.

Prerequisites and System Requirements

- Operating System: Linux distributions such as Ubuntu, Debian, CentOS, or Fedora. The Howto recommends using recent stable releases to ensure compatibility.
- Hardware: At least 2 CPUs, 4 GB RAM (more for larger environments), and sufficient disk space (20 GB or more).
- Network: Static IP address, proper DNS configuration, and network connectivity.
- Dependencies: Required packages include Samba, Kerberos, LDAP, DNS utilities, and others depending on distribution.

Domain Planning and Design

Effective deployment requires careful planning:

- Domain Name: Choose a real DNS domain (e.g., example.com).

- NetBIOS Name: A shorter hostname for compatibility (e.g., EXAMPLE).
- Schema Design: Plan Organizational Units (OUs), user groups, policies.
- DNS Delegation: Decide whether to integrate with existing DNS servers or run a dedicated DNS service.

Step-by-Step Deployment Guide

The core of the Samba 4 Howto is the detailed procedure for setting up your Samba AD DC.

1. Installing Samba 4

Depending on your Linux distribution, installation methods vary:

- Using package managers: apt, yum, dnf, etc.
- Compiling from source: For latest features or custom builds.

Example (Ubuntu):

```
```bash
sudo apt update

sudo apt install samba krb5-user dnsutils smbclient
```
```

Ensure the installed version is 4.11 or higher for full AD support.

2. Preparing the Environment

- Configure hostname:

```
```bash
sudo hostnamectl set-hostname ad.example.com
```
```

- Configure static IP:

Set in `/etc/netplan/` or `/etc/network/interfaces`.

- Configure DNS resolution:

Update `/etc/hosts` and `/etc/resolv.conf` as needed.

3. Provisioning the Samba AD Domain

Use the `samba-tool` utility to create the domain:

```
```bash
sudo samba-tool domain provision \
--domain=EXAMPLE \
--realm=EXAMPLE.COM \
--server-role=dc \
--dns-backend=SAMBA_INTERNAL \
--adminpass='YourStrongPassword'
```
```

This command initializes the AD forest, sets up DNS, Kerberos, LDAP, and necessary services.

Important options:

- `--domain`: NetBIOS name.
- `--realm`: Uppercase DNS domain name.
- `--server-role`: Must be `dc`.
- `--dns-backend`: Internal DNS or external (if integrating with existing DNS).
- `--adminpass`: Directory administrator password.

4. Starting and Enabling Samba Services

After provisioning, start necessary services:

```
``bash
```

```
sudo systemctl start samba-ad-dc
```

```
sudo systemctl enable samba-ad-dc
```

```
``
```

Verify with:

```
``bash
```

```
sudo samba-tool testparm
```

```
``
```

and check logs in `/var/log/samba/`.

5. Configuring DNS and Kerberos

The Howto recommends:

- Ensuring DNS records are correct (A, SRV, CNAME).
- Testing DNS resolution with `dig` or `host`.
- Validating Kerberos configuration in `/etc/krb5.conf`.

Sample `/etc/krb5.conf`:

```
``ini
```

```
[libdefaults]
```

```
default_realm = EXAMPLE.COM
```

```
dns_lookup_realm = false
```

```
dns_lookup_kdc = true
```

...

Post-Deployment Management and Best Practices

Once Samba 4 is operational as an AD DC, ongoing management is vital.

User and Group Management

Use `samba-tool` or Windows tools (via LDAP or AD Users and Computers):

- Creating users/groups:

```
```bash
```

```
sudo samba-tool user add username
```

```
sudo samba-tool group add groupname
```

```
sudo samba-tool group addmembers groupname username
```

...

- Managing passwords:

```
```bash
```

```
sudo samba-tool user setpassword username
```

...

Group Policy Management

Samba 4 supports GPOs similar to Windows:

- Create and link GPOs via `samba-tool` or Windows RSAT tools.
- Edit policies using the Group Policy Management Console (GPMC).

Replication and Backup Strategies

For environments with multiple Samba AD DCs:

- Use `samba-tool drs replicate` for replication.
- Regular backups of LDAP and sysvol:

```
```bash
```

```
sudo samba-tool ntacl sysvol reset
```

```
```
```

- Backup `tdb` and `ldif` files regularly.

Security and Updates

- **Keep Samba up-to-date to mitigate vulnerabilities.**
