Stages of Estimation in Civil Engineering Projects

1. Preliminary (Approximate) Estimation

Preliminary estimation is conducted during the early planning phase when detailed design

information is not yet available. It provides a rough cost overview based on limited data, typically utilizing historical data, unit costs, and broad assumptions. This stage helps in assessing the financial viability of the project.

2. Detailed (Definitive) Estimation

As the project design develops, detailed estimation involves precise measurement of quantities from drawings and specifications. It considers specific materials, labor rates, and equipment costs to produce an accurate cost plan. This stage supports budget approval, tendering, and procurement.

3. Bill of Quantities Preparation

The bill of quantities (BOQ) is a comprehensive document listing all materials, parts, and labor needed for the project, with their respective quantities and unit costs. Accurate BOQ preparation is crucial for tendering and cost control.

4. Cost Control and Monitoring

Throughout construction, ongoing estimation and cost monitoring are necessary to compare actual expenditures against budgets, manage variations, and implement corrective measures.

Methods and Techniques of Estimation

1. Conceptual and Approximate Methods

- Square Footing / Cubic Meter Method: Uses unit costs per area or volume.
